

Pityriasis rubra pilaris (PRP) severe skin disorder

Description

A woman who was suffering from a severe skin disorder, Pityriasis rubra pilaris, describes how BICOM® bioresonance helped her on the road to recovery.

“It’s two years ago today since the very first PRP spot arrived on my face, followed quickly by 10 others, then the explosion across my body. So I thought that since I’m now fully recovered I would be brave and put up the photos I took of myself thought out the illness.

Pityriasis rubra pilaris (PRP)

Over the following week I had 8 appointments with various doctors who gave me steroids, antibiotics none of which worked, I baffled them all. Eventually I got to see a wonderful dermatologist who immediately knew it was PRP.

Within 2 weeks I had a full body CT scan, a skin biopsy, A full photographic session, as it’s such a rare disease they wanted to record it for training purposes.

I could hardly stand up, eat or drink, and as the photos show I was swollen, red and incredibly sore all over. I was given Ciclosporin and Acitretin to take and told I would have PRP for four years.

I was told about Bioresonance by a friend, and initially saw another therapist who then referred me to David Franklin.

After yet another visit to the doctors they admitted me to hospital, I was bright red and even the doctors were horrified. I was shedding layers of skin daily, I was freezing cold, sore, itchy...like ripping your skin off itchy. I was sore and inflamed internally and externally, and my hair began to fall out. They took me off all drugs, I was allergic to the Acitretin!

However they had no idea what had caused the PRP. They said no one knows why it happens...however, Bioresonance did.

David gave me a list of various bacterial infections that I had. One in particular Staphylococcus Albus. It took three day for me to convince the blood nurse to test for this infection. They said it was impossible and that this bacteria lives naturally on our skin. That it couldn't cause this disease.

So, 24 hours later, after they had finally agreed to try to grow the culture, the doctor arrived in the hospital room and said, yes, the bacteria culture is starting to grow and gave me a course of doxycycline and within a couple of days I was feeling much better.

Staphylococcus Albus was treated along with other infections

Still peeling, still sore, still loosing hair, but the redness was calming down, generally I felt better, although still really tired.

No longer on any medication I continued with weekly Bioresonance and got better. Within 3 months I was feeling so much better.

I did however go back on ciclosporin, they said if I didn't PRP would come back get me. BIG mistake. I became ill again, so came off the meds and restarted the Bioresonance, I then got better, and decided to buy my own machine to treat myself and my sister.

So glad I did! I'm fully recovered, discharged from the hospital in January of this year. I'd not been to see them for six months, so they were pleased but also surprised to see I was better. They asked what I did to get better, I explained and they just nodded!

On the road to recovery with the BICOM®

Almost clear within a few months compared to the dermatologist's 4 year estimate

So now, after various training courses, I now treat other people with my BICOM® 2000, I'm delighted to be able to help others.

I'm walking proof that this therapy works.
Thank you for taking the time to read this."

This experience is just one example of someone who had a vast improvement in symptoms thanks to bioresonance. BICOM® therapy has succeeded in helping people with various different skin diseases to achieve better health. In addition, many people with a variety of other health problems such as allergies have also found this [treatment](#) to be effective when conventional medicine has failed to help. The bioresonance method can provide relief safely without causing unpleasant side effects.
