

Why Choose Bioresonance to Treat Headshaking Syndrome

Description

According to [statistics](#), around 2% of all the horses in the UK suffer from headshaking syndrome. This is a common condition for adult horses. It is very difficult to manage, which is why people find it very frustrating.

Horses regularly shake their head. But, the headshaking syndrome is far from normal. You can recognize the signs if you pay attention to the abnormalities. The signs of this condition are violent headshakes accompanied by jerks or flicks of the head. Some horses have nasal irritations as well.

It can often appear in the summer or spring. It depends on how the horse experiences seasonal changes. Basically, every horse breed is susceptible to headshaking.

The Impact of Headshaking

This is a serious problem for the owner and the horse. Based on [statistics](#), it has economic and welfare implications. This is often a painful neuropathic condition. It can affect their everyday life. If the condition causes serious or excruciating pain, the horse can't function. It may have to be euthanized. That is why it is important to find a way to treat this problem. The faster, the better.

What Causes Permanent Headshaking

Permanent headshaking can be a serious issue for horses. They have white discharge coming from their nose. A rider can't ride them.

These are evident signs of permanent headshaking syndrome. Based on this [report](#), it is possible for a horse to experience this particular problem. Veterinarians usually treat it with conventional medicine, like cortisone. But, they don't often notice any positive results.

The horse regularly receives this treatment for a couple of months. However, it doesn't help with the bad cough or bronchitis either. Instead, the horse will probably have to receive antibiotics. In a case such as this one, the reason for the headshaking is usually an allergy or contamination.

How Can Bioresonance Help?

Bioresonance is a therapy that uses applicators to [diagnose and treat](#) diseases. A BICOMÂ® is a device that checks the energy wavelength that comes from the body. It restores proper balance in the system and counteracts the bad frequencies.

When the device is used on a horse with permanent shaking, it can help reveal the source of the problem. The source can be an infestation or allergies. That is where the device comes in. These infestations could affect the nose, intestines, or various other areas in the horse's body. It can locate the allergies, whether they come from different trees, grass, flour mites, or hay.

It can also test vaccines to find out if they are the source of contamination. Some horses could react to vaccines against influenza even if they received them many years before they experienced headshaking.

This is how bioresonance can help treat the problems.

1. It Improves the Horse's Immune System

Antibiotics and cortisone medications can affect the horse's immune system. They block it. Bioresonance therapy can remove all these chemical substances. The process is fast and very straightforward. The BICOMÂ® machine will do all the work. It will focus on removing them from the body and detoxifying the system.

This device is safe for the intestines, kidneys, and liver. In fact, when it starts detoxifying the system, you know it works. This is how it cleanses the horse's body from the substances. It protects the organs from other diseases as well.

2. Treats Allergens and Infections

Regular sessions of bioresonance therapy can treat mycosis. This is a common fungal infection in many animals. Depending on the degree or type of infection, it can be dangerous. It also helps manage allergens like from grass, trees, hay, or flour mites. If the animal receives probiotics, they can help further cleanse the colon. This allows the body to function on its own properly.

3. Manages Headshaking

If the horse receives regular treatment sessions, bioresonance can help treat the problem. The headshaking will reduce slowly. At first, the animal can experience occasional shaking. But, after a couple of sessions, the headshaking can disappear. Based on the same [report](#), there is a possibility the horse may not even experience a relapse.

Why Choose Bioresonance?

Bioresonance is completely different from regular synthetic therapies. It uses electromagnetic waves to locate and deal with the illness. In other words, it is a natural alternative with no side effects. It can pinpoint the disease in its early stages. This is something not many other therapies can achieve.

Conclusion

Since the bioresonance therapy stimulates the horse's immune system, the body will be able to defend itself from invaders. These invaders are fungi, bacteria, or various other infections. Long-term bioresonance therapy can boost the regeneration process. It stimulates the cells to heal themselves. This helps the organ tissues get back on track.

The treatment improves the tissues in the neck and allows the body to manage and control the head. After multiple sessions, the cells will fully heal. That is why the horse may never experience a relapse.
